**DETAILED ACTION**

1. This office action is in response to a communication mailed on 03/09/09. Claims 2-11, 13-15, 17-31, 33-35, 38-54 are pending. Claims 1, 12, 16, 32 and 36-37 are canceled.

***Claim Rejections - 35 USC § 112***

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. Claim 26 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.
4. Claim 26 recites “said longitudinal direction of said slit”. There is insufficient antecedent basis for this limitation in the claim.

***Claim Rejections - 35 USC § 103***

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 20, 26 and 42 are rejected under 35 U.S.C. 103(a) as being unpatentable over Conner et al. (USPN 7113231).

Regarding 20 and 42, Conner et al. (USPN 7113231) teaches a dot sequential color display system as shown in Fig. 1 including a projection lens assembly 26 projecting the overlapping images of color component sub-pixels or dots onto a display screen 28 that is viewed by one or more observers. As shown in Fig. 1, Conner also teaches the use of pixelated electronic display (e.g., a liquid crystal display) (20). Conner teaches as shown in Fig. 5 a display device 58 illustrating that at each of times  $t$ , pixel columns  $x$  and  $x+3$  receive blue color component information, pixel columns  $x+1$  and  $x+4$  receive green color component information, and pixel columns  $x+2$  and  $x+5$  receive red color component information (col. 7, lines 26-34).

Conner does not specifically teach  $M \times N$  number of sub-pixels included in a display pixel which is formed within a square area and a lenticular lens /parallax barrier for distributing light rays from the sub-pixels individually to  $N$  number of view points.

However, Conner teaches a dot sequential color display system as shown in Fig. 1 including a projection lens assembly 26 projecting the overlapping images of color component sub-pixels or dots onto a display screen 28 that is viewed by one or more observers. Note that the subpixels can be arranged in rectangular fashion as evidenced in Fig. 23 in which full-color triplet of sub-pixels 302 are arranged. Also see Fig. 16 in which sub-pixels A, D, B, and C are configured and are arranged in a square fashion.

Thus it would have been obvious to one of ordinary skill in the art at the time the invention was made to utilize Conner's color component sub-pixels (which could be configured as a square) with respect to the desired number of viewers, because the number of viewers/observers can be more than one and hence can vary as taught by Conner.

***Allowable Subject Matter***

6. Claims 21-25 objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

7. Claims 2-11, 13-15, 17-19, 27-31, 33-35, 38-41 and 43-54 are allowed.
